veer.m@northeastern.edu | 857-351-9373 | [LinkedIn](#) | [GitHub](#) | [Portfolio](#)

EDUCATION

Northeastern University, Boston, MA

Master of Science in Software Engineering Systems

GPA: 3.85/4

Relevant courses: Concepts of Object-Oriented Design, Web Design and User Experience Engineering, Program Structure and Algorithms, Network Structures and Cloud Computing

K.J. Somaiya College of Engineering, Mumbai, MH, INDIA

Bachelor of Technology in Electronics

Expected May 2026

May 2021

TECHNICAL SKILLS

- **Languages:** Python, Java, JavaScript, TypeScript, HTML, CSS, SCSS, SQL, Shell, YAML, HCL
- **Frameworks:** Flask, FastAPI, Angular | **Databases:** MSSQL, PostgreSQL, SQLite | **Tools:** Power BI, Tableau
- **DevOps:** CI/CD pipeline, Kubernetes, Docker, GitHub Actions, DigitalOcean, Terraform, Packer, AWS, GCP, Linux
- **Certificates:** Data Science and Statistics, Deep Learning, R Programming, Tableau – Internshala (2021), Python – Sadguru classes (2020), Machine Learning with Python – K.J. Somaiya College of Engineering (2020)

PROFESSIONAL EXPERIENCE

Ernst & Young LLP, Mumbai, INDIA

Sept 2021 – Aug 2024

Team Lead – Full Stack Developer

- Optimized performance and developed persistent state management, reducing unnecessary re-renders and load times by 60% by using React's Context API with context selectors and localStorage
- Reduced rendering time by 50% by using Angular's lifecycle hook ngOnChanges to refresh data based on conditions instead of reloading the whole page
- Achieved reduction in manual effort by 90% building an Arabic Invoice Generator for Formula 1, automating the process of reading English PDFs translating them to Arabic with context-aware accuracy translation library, and dynamically generating RTL-formatted invoices with precise text alignment and layout
- Cut execution time by 66.7% designing a recursive Python script to convert JSON files to tabular data and flat files to back to JSON in the same format, while effectively managing exceptional scenarios
- Optimized processing efficiency by 17.14x and reduced processing time by 94.17% refining code using Pandas that converts flat files to a tree structure, decreasing the time from 1 hour for 1,800 invoices to just 3.5 minutes for 25,000 invoices

Zinc Technologies, Mumbai, INDIA

Apr 2021 – May 2021

Python Developer Intern

- Optimized data processing pipeline, and reducing memory utilization by 52% modifying concurrent code to directly insert tables into the database instead of appending to a DataFrame
- Improved data retrieval speed, fetch information for 100 books in 2 minutes by using multithreading approach
- Migrated database architecture from SQLite to PostgreSQL, to improve concurrent transaction handling, and reduce execution time by 63% by leveraging PostgreSQL's MVCC

PROJECTS

End-to-End Cloud Integration & CI/CD Automation | Terraform, Shell, Packer, AWS, GCP, Python, GitHub Actions

- Developed a cloud-based Health API system using Python and PostgreSQL, enhancing data security and optimizing healthcare data processing
- Automated infrastructure provisioning with Terraform, creating subnets, EC2 instances, and VM instances on AWS and GCP for seamless deployment
- Built AWS AMIs and GCP Compute Images using Packer with shell scripts, ensuring consistent environment setup and scalable infrastructure
- Implemented CI/CD pipelines with GitHub Actions, automating API testing, validating Packer files, and managing cross-environment image migrations
- Integrated AWS CloudWatch for monitoring, AWS RDS for database management, and AWS S3 for secure data storage, ensuring reliable cloud operations

Eventify | TypeScript, MongoDB, Express, React, NodeJS, HTML, SCSS, Git

- Engineered a full-stack event management platform, Eventify, enhancing user experience with React Redux for state management, PWA for offline capabilities, and internationalization to support multiple languages
- Integrated Stripe for secure payments, Google Maps for location-based event discovery, and a QR code scanner for seamless event check-ins, improving transaction efficiency and attendee management
- Leveraged Fugu API for real-time chat functionality, enabling instant communication between event organizers and attendees, enhancing user engagement and support

Comic Downloader | JavaScript, React, FastAPI, Sqlite3, OS, requests, BeautifulSoup, HTML, CSS, Git

- Established an application with URL/text-based comic information retrieval, issue selection, and image download to local directory or PDF generation, downloads more than 10 comics in under 1 minute
- Built the backend using Python with APIs, and deployed via Uvicorn, and constructed the frontend with ReactJS for seamless user interaction experience for over 100 daily active users
- Integrated offline reading functionality, enabling the app to store the comic's name and page number, allowing users to resume reading from where they left off

Netflix Clone | JavaScript, MongoDB, Express, React, NodeJS, HTML, CSS, Git

- Engineered a fully responsive Netflix-inspired streaming platform with an intuitive UI, featuring a dynamic landing page enriched with high-quality visuals and video previews of trending series
- Leveraged TMDB API to deliver real-time movie and series trailers, enhancing user engagement with an interactive browsing experience
- Implemented a robust authentication system using JWT with token expiry, ensuring secure and seamless access while maintaining session integrity
