

MAYUR VEER

veer.m@northeastern.edu | 857-351-9373 | [LinkedIn](#) | [GitHub](#) | [Portfolio](#)

EDUCATION

Northeastern University, Boston, MA

Expected May 2026

Master of Science in Software Engineering Systems

Relevant courses: Concepts of Object-Oriented Design, Web Design and User Experience Engineering, Program Structure and Algorithms, Network Structures and Cloud Computing, High Performance Computing for AI, User Experience Design and Testing

K.J. Somaiya College of Engineering, Mumbai, MH, INDIA

May 2021

Bachelor of Technology in Electronics

TECHNICAL SKILLS

- **Languages:** Python, Java, JavaScript, TypeScript, HTML, CSS, SCSS, SQL, Shell, YAML, HCL
- **Frameworks:** Flask, FastAPI, Angular | **Databases:** MSSQL, PostgreSQL, SQLite | **Tools:** Power BI, Tableau
- **DevOps:** CI/CD pipeline, Kubernetes, Docker, GitHub Actions, Terraform, Packer, AWS, GCP, Linux
- **Certificates:** Data Science and Statistics, Deep Learning, R Programming, Tableau – Internshala (2021), Python – Sadguru classes (2020), Machine Learning with Python – K.J. Somaiya College of Engineering (2020)

PROJECTS

End-to-End Cloud Integration & CI/CD Automation | Terraform, Shell, Packer, AWS, GCP, Python, GitHub Actions

- Automated infrastructure provisioning for 3+ environments by creating 15+ resources (VPCs, EC2/VMs, ALBs, ASGs, target groups) using **Terraform across AWS and GCP**, reducing manual effort by 80%
- Improved subdomain reliability by 99.9% by configuring **Route53 via Terraform** to handle DNS routing for dev and demo, and attaching **SSL** from ACM/ssl.com to respective load balancers with health checks and multi-AZ distribution for high availability
- Enhanced infrastructure security for 100% of services by integrating **AWS KMS** encryption (EC2, RDS, S3), **Secrets Manager** for credentials, and **CloudWatch** for real-time logging and alerts, with autoscaling groups configured for automatic security patching and compliance
- Reduced image provisioning time by 60% by automating **AMI and GCP** image creation with **Packer and shell scripts** for consistent deployment environments, optimized for autoscaling launch templates with pre-configured monitoring agents
- Decreased deployment time by 75% by building **CI/CD** pipelines using **GitHub Actions** with **PyTest** for automated API testing, enabling seamless rollout of a Python-PostgreSQL API via instance refresh and AMI updates with zero-downtime deployments through Application Load Balancer target group management and rolling updates

Eventify | TypeScript, MongoDB, Express, React, NodeJS, HTML, SCSS, Git

- Built a full-stack event platform with 5+ core modules (auth, booking, search, payments, chat), improving user retention by 30% using **React Redux**, PWA offline support
- Implemented **Internationalization (i18n)** to support 6+ languages, enhancing accessibility and expanding user base across global regions
- Boosted payment processing efficiency by 40% by integrating **Stripe**, **Google Maps**, and QR-based check-ins, streamlining event logistics for 100+ users
- Increased user engagement by 25% by implementing **Fugu API for real-time** chat between event organizers and attendees, enhancing support and communication

Comic Downloader | Python, JavaScript, React, FastAPI, Sqlite3, OS, requests, BeautifulSoup, HTML, CSS, Git

- Established an application with URL/text-based comic information retrieval, issue selection, and image download to local directory or PDF generation, downloads more than 10 comics in under 1 minute
- Built the backend using Python with **FastAPI**, and deployed via **Uvicorn**, and constructed the frontend with **ReactJS** for seamless user interaction experience for over 100 daily active users
- Integrated offline reading functionality, enabling the app to store the comic's name and page number, allowing users to resume reading from where they left off

Netflix Clone | JavaScript, MongoDB, Express, React, NodeJS, HTML, CSS, Git

- Developed a Netflix-style streaming platform with responsive UI and dynamic landing page using **Tailwind CSS**, resulting in a 50% increase in session time across devices
- Enhanced content discovery by 40% by integrating **TMDB API** for real-time trailers and previews of trending media
- Secured user sessions with 100% **JWT-based** authentication system, reducing unauthorized access and session errors by 90%

PROFESSIONAL EXPERIENCE

Ernst & Young LLP, Mumbai, INDIA

Sept 2021 – Aug 2024

Team Lead – Software Engineer

- Optimized performance and developed persistent state management, reducing unnecessary re-renders and load times by 60% by implementing React's **useCallback** hook for memoized functions, context selectors for targeted state updates, and **localStorage** for data persistence
- Reduced rendering time by 50% by using Angular's lifecycle hook **ngOnChanges** to refresh data based on conditions instead of reloading the whole page
- Achieved reduction in manual effort by 90% building an Arabic Invoice Generator for Formula 1, automating the process of reading English PDFs translating them to Arabic with **context-aware** accuracy translation library, and dynamically generating **RTL-formatted** invoices with precise text alignment and layout
- Cut execution time by 66.7% designing a recursive Python script to convert JSON files to tabular data and flat files to back to **JSON** in the same format, while effectively managing exceptional scenarios
- Optimized processing efficiency by 17.14x and reduced processing time by 94.17% refining code using **Pandas** that converts flat files to a tree structure, decreasing the time from 1 hour for 1,800 invoices to just 3.5 minutes for 25,000 invoices
